

## Expected from you in this symposium

Present your project work in a talk of 15 minutes guided by a projected presentation. The talk is followed by 5 minutes question session. Stay within the time, to benefit the most from the potential knowledge or tips the audience might provide.

## How to give a good scientific presentation

### Why giving a presentation is important

Scientific communication is essential for helping us to understand this world. Researchers who discover the wonders of science must tell others about their findings in clear terms. Scientists must communicate their information of new discoveries in order to add to the pool of scientific knowledge.

### Parts of a presentation

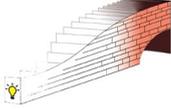

Your presentation will be far more interesting and appreciated if you consider the following instructions:

#### Your slides:

- 1 to max 2 slides should be general introduction for the experts and all those who are not exactly from your field of research.
- The rest of the presentation should be on the particular topic. **The maximum number of slides is 10.**
- Select only major points of your work and present them clearly. Your audience cannot absorb more within 10 min.
- Use illustrating cartoons and simple figures to ensure comprehensibility.
- Use keywords and short comments on your slides. **Avoid long texts.**
- Plot clear diagrams with understandable labels on each fact. Avoid overcrowded graphics with long legends.
- Clearly state your conclusion, what hypotheses were proved or what was improved by your research.
- As part of this year's theme "*From Visions to Reality - Bridging materials science for a more sustainable future*", presentations should touch on how your own research might be translated into commercially viable technologies.

#### Your talk:

- Rehearse your presentation in front of an audience.
- Make sure you are able to stay within 15 min time limit. If you exceed the time limit the chairman will stop your presentation.

- Speak slowly, loudly and clearly. Use short sentences, they are easier to understand.
- Remember that most of the people in your audience will know less than you about your subject, thus keep it as simple as possible.
- Restrict yourself to one slide per 1–2 min.
