

Research and Development

Our research is focused on sustainable solutions for the growing needs in the fields of road engineering and sealing components. In order to facilitate our work we cooperate with the public service, private companies and the international scientific community. Our highly competent collaborators, our modern and sophisticated equipment and our contacts with both practice and research enable us to deal with complex and interdisciplinary projects.

Development and optimization of sustainable building materials

- Durable pavements
- New types of bituminous mixtures and their properties
- Recycling and the environment
- Effects of micro-particles

Investigation and modelling of the performance of pavement and sealing systems

- Accelerated pavement testing in-situ and in laboratory
- Monitoring of the performance of pavements and sealing systems
- System properties and modelling
- Vehicle-road interaction
