

Development of the annual mean value for PM10 since 1990 at the NABEL site in Zurich (urban background site). Up to the end of the 90's PM10 values are decreasing. Since then annual means of PM10 seems to be constant at a too high level (annual air quality standard is $20 \mu\text{g}/\text{m}^3$). To improve the situation, additional reduction measures are needed.
